The table below summarises the geometric issues observed across the polymeric chains and their fit to the electron density. The red, orange, yellow and green segments on the lower bar indicate the fraction of residues that contain outliers for  $\geq 3$ , 2, 1 and 0 types of geometric quality criteria. A grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions  $\leq 5\%$ . The upper red bar (where present) indicates the fraction of residues that have poor fit to the electron density. The numeric value is given above the bar.

- The image displays the chemical structure of Flavin Adenine Dinucleotide (FAD). It consists of an adenine base (a purine ring system with an amino group at position 6) linked to a ribose sugar. The ribose sugar is connected to a pyrophosphate bridge, which is further linked to another ribose sugar. This second ribose sugar is attached to a riboflavin moiety (a benzene ring fused to a pyrimidine ring, with a ketone group at position 4 and a dimethylamino group at position 2). The structure is shown in a 3D representation with stereochemistry indicated by wedges and dashes.

### 3 Residue-property plots

These plots are drawn for all protein, RNA and DNA chains in the entry. The first graphic for a chain summarises the proportions of errors displayed in the second graphic. The second graphic shows the sequence view annotated by issues in geometry and electron density. Residues are color-coded according to the number of geometric quality criteria for which they contain at least one outlier: green = 0, yellow = 1, orange = 2 and red = 3 or more. A red dot above a residue indicates a poor fit to the electron density ( $RSRZ > 2$ ). Stretches of 2 or more consecutive residues without any outlier are shown as a green connector. Residues present in the sample, but not in the model, are shown in grey.
