The table below summarises the geometric issues observed across the polymeric chains and their fit to the electron density. The red, orange, yellow and green segments on the lower bar indicate the fraction of residues that contain outliers for ≥ 3 , 2, 1 and 0 types of geometric quality criteria. A grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions $\leq 5\%$. The upper red bar (where present) indicates the fraction of residues that have poor fit to the electron density. The numeric value is given above the bar.

- The chemical structure is a complex polycyclic molecule, likely a natural product, featuring multiple fused rings and several hydroxyl groups. The structure is labeled with atom names (C, O, N) and numbers (1-28) indicating specific positions. Key features include:
- A central nitrogen atom (N48) in a blue ring, which is part of a fused system.
 - Multiple hydroxyl groups (OH) attached to various carbon atoms, some in red and some in black.
 - A complex arrangement of fused rings, including a cyclohexane ring (C1A(5) to C7A) and a cyclohexane ring (C10A(5) to C16A).
 - Several oxygen atoms (O) are present, some as part of ether linkages and others as hydroxyl groups.
 - The structure is highly symmetrical, with many atoms labeled with the same name (e.g., C1A(5), C2A(5), C3A(5), C4A(5), C5A(5), C6A(5), C7A(5)).

- Molecule 3 is water.

3 Residue-property plots

These plots are drawn for all protein, RNA and DNA chains in the entry. The first graphic for a chain summarises the proportions of errors displayed in the second graphic. The second graphic shows the sequence view annotated by issues in geometry and electron density. Residues are color-coded according to the number of geometric quality criteria for which they contain at least one outlier: green = 0, yellow = 1, orange = 2 and red = 3 or more. A red dot above a residue indicates a poor fit to the electron density ($RSRZ > 2$). Stretches of 2 or more consecutive residues without any outlier are shown as a green connector. Residues present in the sample, but not in the model, are shown in grey.

Xtriage's analysis on translational NCS is as follows: *The analyses of the Patterson function reveals a significant off-origin peak that is 82.90 % of the origin peak, indicating pseudo translational symmetry. The chance of finding a peak of this or larger height randomly in a structure without pseudo translational symmetry is equal to 2.4837e-07. The detected translational NCS is most likely also responsible for the elevated intensity ratio.*

¹ Intensities estimated from amplitudes.

² Theoretical values of $\langle |L| \rangle$, $\langle L^2 \rangle$ for acentric reflections are 0.5, 0.375 respectively for untwinned datasets, and 0.333, 0.2 for perfectly twinned datasets.
